### 2.6.1. CPU Cooler Assembly

Step 1:

---

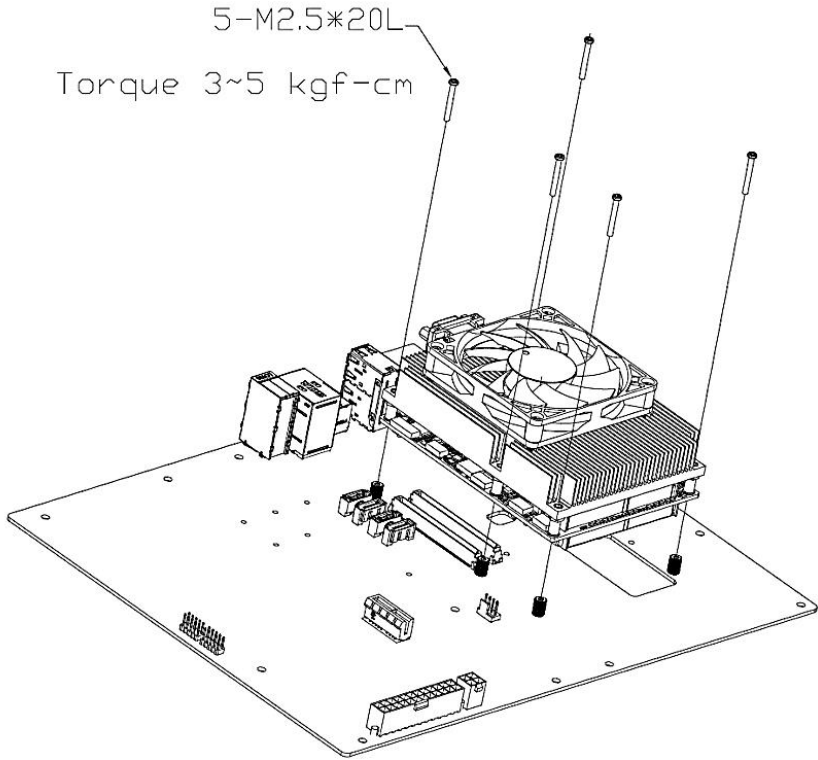

**Note:** Slightly tighten all four screws in diagonal order. Then, repeat with torque 3~5 kgf-cm with proper tools.

---

**Note:** According to the CPU spec, the CPU Tcase should be kept at or below 85°C for your thermal design consideration.

Step 2:

## 3. AMI BIOS Setup

### 3.1. System Test and Initialization

These routines test and initialize board hardware. If the routines encounter an error during the tests, you will either hear a few short beeps or see an error message on the screen. There are two kinds of errors: fatal and non-fatal. The system can usually continue the boot up sequence with non-fatal errors.

#### System configuration verification

These routines check the current system configuration stored in the CMOS memory and BIOS NVRAM. If system configuration is not found or system configuration data error is detected, system will load optimized default and re-boot with this default system configuration automatically.

There are four situations in which you will need to setup system configuration:

1. You are starting your system for the first time.
2. You have changed the hardware attached to your system.
3. The system configuration is reset by Clear-CMOS jumper.
4. The CMOS memory has lost power and the configuration information has been erased.

The ACM-ICLDE7 CMOS memory has an integral lithium battery backup for data retention. However, you will need to replace the complete unit when it finally runs down.

### 3.2. AMI BIOS Setup

AMI BIOS ROM has a built-in Setup program that allows users to modify the basic system configuration. This type of information is stored in battery-backed CMOS RAM and BIOS NVRAM so that it retains the Setup information when the power is turned off.

Entering Setup

Power on the computer and press <Del> or <ESC> immediately. This will allow you to enter Setup.
